

AI WEBSITE PROTOTYPE GENERATION BRIEF

PROJECT CONTEXT

You are acting as a **senior product designer, UX strategist, frontend engineer, and early-stage EdTech product architect**.

Design and build a polished **base prototype website/web application** for a new student productivity product.

This is an **early-stage prototype**, not the final production application.

The purpose of this prototype is to:

1. Visualize the product concept.
2. Test the proposed user experience.
3. Compare different AI-generated design approaches.
4. Create a strong base that our development team can later refine.
5. Demonstrate the core product workflow without unnecessarily building advanced infrastructure.

Do NOT turn this into a generic productivity dashboard.

The product must clearly feel designed specifically for **Cambridge International A-Level students preparing for examinations**.

1. PRODUCT CONCEPT

Working product name:

[PRODUCT NAME]

Use a tasteful temporary name if necessary, but make the branding easy to replace later.

The product combines:

A-Level Study Planning

Students should be able to:

- Select their A-Level subjects.
- View syllabus topics.
- Track syllabus progress.

- Create revision tasks.
- Set deadlines.
- Receive reminders.
- See upcoming work clearly.

Past Paper Performance Tracking

Students should be able to:

- Record completed past papers.
- Enter scores.
- View score trends.
- Compare performance across papers.
- Identify weak subjects or components.
- See improvement over time.

The long-term vision is an intelligent A-Level revision management platform.

However, this prototype must remain focused on the MVP.

2. CORE PROBLEM

Cambridge A-Level students often struggle with:

- Knowing exactly what they should revise next.
- Keeping track of syllabus completion.
- Setting realistic revision deadlines.
- Maintaining consistent study habits.
- Tracking past-paper performance.
- Identifying whether their scores are actually improving.
- Managing multiple subjects simultaneously.
- Procrastinating because revision goals are vague.
- Using separate planners, spreadsheets, calendars and notes for different parts of their revision.

The product should reduce this fragmentation.

The central experience should communicate:

Know what to study, know what you have completed, and know whether you are improving.

3. TARGET USERS

Primary users:

Cambridge International AS & A-Level students.

Typical age:

Approximately 16–19.

Initial subject categories may include:

- Mathematics
- Further Mathematics
- Physics
- Chemistry
- Biology
- Computer Science
- Business
- Economics
- History
- English Language

Do NOT attempt to create the complete Cambridge subject catalogue.

Use approximately 6–10 example subjects in the prototype.

The system architecture and interface should make it obvious that more subjects can later be added.

4. PRODUCT PRINCIPLES

Every design decision should follow these principles.

Simple

A stressed student should understand the interface almost immediately.

Avoid overwhelming dashboards.

Useful

Every major element should help the student:

- plan,
- track,
- understand,
- or act.

Avoid decorative features with no purpose.

A-Level Specific

The app should visibly reference things such as:

- Subjects
- Syllabus topics
- Components
- Past papers
- Raw marks
- Percentages
- Exam dates
- Revision progress

Do not make it look like a generic Todoist, Notion, or project-management clone.

Low Friction

Students should not have to manually create their entire syllabus.

The product concept assumes syllabus structures will eventually be stored in the system.

A student selects a subject and the syllabus becomes available automatically.

Calm Rather Than Overstimulating

The interface is intended for students who may already be stressed.

Avoid:

- Excessive colours
- Childish visual design
- Constant animations
- Excessive badges
- Too many cards
- Dense information
- Gamification everywhere

Use visual hierarchy and whitespace.

Motivating

The product should nevertheless feel encouraging and modern.

Use subtle progress indicators, streaks and positive feedback.

5. DESIGN DIRECTION

Create a modern educational productivity interface.

The visual style should feel:

- Clean
- Calm
- Modern
- Intelligent
- Youthful without being childish
- Premium without looking corporate
- Focused
- Minimal
- Friendly

Use strong typography and generous spacing.

Use a primarily neutral interface with a limited accent palette.

Subject colours may be used selectively to differentiate subjects.

Do not use a rainbow of colours across every component.

Avoid excessive gradients.

Avoid glassmorphism everywhere.

Avoid overly futuristic AI aesthetics.

Avoid making every section a floating card.

The interface should look credible as a real product that A-Level students could use every day.

6. RESPONSIVE DESIGN

The prototype must work well on:

- Desktop
- Tablet
- Mobile

Desktop should feel like the primary productivity workspace.

Mobile should remain genuinely usable rather than simply shrinking the desktop layout.

Use responsive navigation patterns where appropriate.

7. CORE APPLICATION NAVIGATION

Create a clear application navigation system.

Recommended primary navigation:

Dashboard

Overview of the student's current revision status.

My Subjects

Syllabus and subject progress.

Study Plan

Tasks, deadlines and revision schedule.

Past Papers

Past-paper logging and performance tracking.

Progress

Analytics across subjects and study activity.

Calendar

Upcoming tasks, deadlines and examination dates.

Settings

Account, notifications and integrations.

Do not add unnecessary sections merely to make the application appear larger.

8. LANDING PAGE

Create a polished public landing page before the application dashboard.

The landing page should quickly explain the product.

Hero Section

Possible headline:

Take control of your A-Level revision.

Supporting message:

Plan your syllabus, stay on top of deadlines, track past-paper performance and see exactly where you are improving.

Primary CTA:

Get Started Free

Secondary CTA:

See How It Works

Include a strong visual preview of the dashboard.

Do NOT make unsupported claims such as:

“Guaranteed A* grades.”

Problem Section

Show common student frustrations such as:

- “What should I revise today?”
- “How much of my syllabus is actually finished?”
- “Am I improving in past papers?”
- “Which subject needs the most attention?”

Then demonstrate how the product answers them.

Core Features Section

Show four primary capabilities:

Plan

Turn syllabus topics into manageable revision tasks.

Track

See exactly how much of each subject you have covered.

Practise

Record past-paper attempts and scores.

Improve

Understand where your performance is increasing or falling behind.

A-Level Specialisation Section

Clearly explain that the product is built specifically around Cambridge A-Level exam preparation.

This is important to the product's differentiation.

CTA / Early Access Section

Because the product is initially free, include language such as:

Start organising your A-Level revision for free.

9. ONBOARDING EXPERIENCE

Create a short, low-friction onboarding process.

Avoid a long questionnaire.

Step 1 — Welcome

Briefly explain what the product does.

Step 2 — Select Subjects

Allow users to select example subjects such as:

- Mathematics
- Physics
- Chemistry
- Biology
- Computer Science
- Economics
- Business
- History

Use search and selectable subject cards.

Step 3 — Study Details

Allow optional selection of:

- AS Level
- A Level
- Exam session
- Approximate exam dates

Do not make every field mandatory.

Step 4 — Ready

Show the selected subjects and take the student directly to their dashboard.

The goal should be:

\$\$ \text{Sign Up} \rightarrow \text{Select Subjects} \rightarrow \text{Dashboard} \$\$

with as little friction as possible.

10. AUTHENTICATION DESIGN

Create authentication screens.

Primary option:

Continue with Google

Secondary option:

Continue with Email

Also provide:

- Sign in
- Sign up
- Forgot password

Do not prioritize Microsoft or Apple authentication in this prototype.

Authentication can use mock functionality if real authentication is outside the scope of the generated prototype.

11. DASHBOARD

The dashboard should answer:

“What do I need to do, and how am I doing?”

Do NOT overwhelm the student with analytics.

Include the following.

Welcome Area

Example:

Good afternoon, Alex

You have 3 tasks planned today.

Keep it simple.

Today's Plan

Example tasks:

Physics

Electric Fields — Review notes

Due today

Mathematics

Complete Integration topical questions

Due today

Chemistry

Revise Equilibria

Due tomorrow

Students should be able to:

- Mark tasks complete.
- Open a task.
- Add a new task.

Upcoming Deadlines

Show several upcoming items with:

- Task
- Subject
- Due date
- Priority

Subject Progress

Show a compact progress overview.

Example:

Mathematics — 68%

Physics — 54%

Chemistry — 72%

Computer Science — 61%

Do not imply that percentages are automatically calculated unless based on tracked syllabus completion.

Study Streak

Include one subtle streak indicator.

Example:

5-day study streak

Do NOT turn the entire application into a game.

Recent Past-Paper Performance

Example:

Physics 9702 Paper 4

Previous: 61%

Latest: 69%

Change: +8 percentage points

Show this visually but calmly.

Quick Actions

Include:

- Add task
 - Log past paper
 - View syllabus
 - Add exam date
-

12. MY SUBJECTS PAGE

Create a subject overview page.

Each subject card should show:

- Subject name
- Subject code where appropriate
- Overall syllabus progress
- Upcoming tasks
- Recent past-paper score

Example:

Physics — 9702

Syllabus progress: 54%

3 topics currently in progress

Next task: Electric Fields topical questions

Recent paper: Paper 4 — 69%

13. INDIVIDUAL SUBJECT PAGE

When the user opens a subject, provide tabs or sections such as:

Overview

Syllabus

Tasks

Past Papers

Performance

14. SYLLABUS TRACKER

This is one of the product's major differentiators.

Create a structured syllabus interface.

Example:

Physics 9702

Mechanics

✓ Motion in a circle

✓ Gravitational fields

● Oscillations

○ Thermal physics

Use clear status states such as:

- Not Started
- In Progress
- Completed

Allow individual syllabus topics to be expanded.

A topic may show:

- Progress status
- Related tasks
- Personal notes
- Add revision task

Do not require students to type syllabus topic names manually.

Use mock syllabus data for the prototype.

15. STUDY PLAN

Create an intuitive task-management interface specifically for revision.

Allow users to:

- Create revision tasks.
- Select subject.
- Select syllabus topic.
- Set deadline.
- Add priority.
- Add estimated duration.
- Mark complete.

Example task creation:

Task

Complete Circular Motion topical questions

Subject

Physics

Topic

Motion in a Circle

Deadline

Thursday

Estimated time

45 minutes

Avoid building a complex project-management system.

This is a student revision planner, not Jira.

16. TASK VIEWS

Support simple views such as:

Today

Upcoming

Completed

Optionally:

Calendar

Avoid excessive filtering.

17. PAST PAPER TRACKER

This is another major product feature.

Create a fast past-paper logging workflow.

A student should be able to enter:

Subject

Physics

Paper

9702/42

Year / Session

May/June 2025

Score

61

Total Marks

100

Date Attempted

[Date]

Time Taken

Optional

Notes

Optional

The process should take approximately 30 seconds or less.

18. PAST PAPER DASHBOARD

Show meaningful information such as:

Latest Score

69%

Average Score

64%

Best Score

78%

Papers Completed

8

Include a clean score-trend chart.

Example data:

Paper 1 — 56%

Paper 2 — 59%

Paper 3 — 64%

Paper 4 — 63%

Paper 5 — 69%

Show improvement clearly.

19. COMPONENT ANALYSIS

Because Cambridge subjects often contain multiple components, allow the interface to distinguish between them.

Example:

Physics:

Paper 1 — Multiple Choice

Paper 2 — AS Structured Questions

Paper 3 — Advanced Practical Skills

Paper 4 — A Level Structured Questions

Paper 5 — Planning, Analysis and Evaluation

The prototype does not need complete Cambridge metadata.

Use realistic mock data.

20. PERFORMANCE INSIGHTS

Create simple useful insights.

Examples:

Physics is improving

Your last three papers increased from 61% to 69%.

Mathematics needs attention

Your average score has fallen across your last two attempts.

Suggested next step

Review Integration before attempting another Pure Mathematics paper.

For this prototype these recommendations may be generated from mock/rule-based data.

Do NOT require a live AI API.

21. PROGRESS PAGE

Create a consolidated analytics page.

Potential sections:

Syllabus Completion

Progress by subject.

Past Paper Scores

Score trends.

Study Consistency

Tasks completed over time.

Subject Comparison

Which subjects currently need the most attention.

The analytics must be actionable.

Avoid charts that exist only because dashboards are expected to contain charts.

22. CALENDAR

Create an integrated calendar view containing:

- Revision tasks
- Deadlines
- Exam dates
- Past-paper practice sessions

Allow users to distinguish between these item types.

23. GOOGLE CALENDAR INTEGRATION

Design the interface for optional Google Calendar integration.

Example setting:

Connect Google Calendar

Sync:

☒ Revision deadlines

☒ Exam dates

☐ Study sessions

This integration must be OPTIONAL.

Do not force students to use Google Calendar.

For the prototype, the connection may be represented visually rather than implemented fully.

24. REMINDERS

Create notification preferences.

Possible reminder options:

- Morning task summary
- Upcoming deadline
- Missed task reminder
- Evening progress summary
- Exam reminder

Email notifications are an important potential channel.

Do not create overly aggressive notification behaviour.

25. FOCUS FEATURE

Do NOT build a full website/app blocker.

The team has deliberately postponed strict distraction blocking because:

- It is technically difficult.
- Students may bypass it.
- Students sometimes need external websites for legitimate study resources.

Instead, represent Focus Buddy as a future/light feature.

Example:

Focus Session

Choose task

Choose duration

Start session

During the session the interface can display a distraction-free study timer.

This should remain secondary to the core planner.

26. TOPICAL QUESTION SUPPORT

Do NOT host copyrighted external topical-question content.

Instead allow students to create tasks such as:

Complete Physics Electric Fields topical questions

The interface can contain a section such as:

Practice Resources

with example external resource placeholders.

Do not scrape or reproduce copyrighted exam resources.

The eventual system may recommend legitimate third-party topical resources.

27. GAMIFICATION

Keep gamification light.

Use:

- Study streak
- Completion progress
- Small positive messages
- Occasional milestones

Example:

You've completed 80% of your Physics plan this week.

Avoid:

- Excessive XP
- Virtual currencies
- Dozens of badges
- Competitive leaderboards
- Confetti after every action

The app should feel productive rather than addictive.

28. EMPTY STATES

Design useful empty states.

Example for Past Papers:

No papers logged yet

Log your first past paper to start tracking your performance.

[Log Past Paper]

Example for Tasks:

Nothing planned today

Add a revision task or take a look at your syllabus.

Empty states should guide the user toward an obvious next action.

29. EXAMPLE USER DATA

Populate the prototype using realistic mock data.

Example student:

Name: Alex

Subjects:

- Mathematics 9709
- Physics 9702
- Chemistry 9701
- Computer Science 9618

Use realistic-looking topics, tasks and paper codes.

Do not fill the interface with lorem ipsum.

30. SETTINGS

Include:

Account

Name

Email

Subjects

Manage selected subjects.

Notifications

Configure reminders.

Integrations

Google Calendar.

Appearance

Light / Dark / System.

Data

Export data

Delete account

31. ACCESSIBILITY

The application should have:

- Strong colour contrast
- Clear text hierarchy
- Keyboard-accessible controls
- Visible focus states
- Appropriate button sizes
- Accessible form labels
- Sensible mobile touch targets

Do not use colour alone to communicate progress or status.

32. TECHNICAL EXPECTATIONS

For the prototype:

- Use clean reusable components.
- Use a maintainable project structure.
- Avoid unnecessary dependencies.
- Avoid hard-coding every screen independently.
- Use mock/local data where a backend is unnecessary.
- Keep the architecture ready for future backend integration.
- Use responsive layouts.
- Make navigation functional.
- Make important buttons and interactions work.

Where implementation choices are required, prefer modern, stable and commonly supported technologies.

If using React:

- Use TypeScript.
- Use reusable components.
- Keep data structures typed.
- Separate UI components from mock data where practical.

Do NOT add unnecessary infrastructure simply to appear sophisticated.

33. DO NOT BUILD YET

Do NOT implement the following as major features:

- Teacher dashboards
- Parent dashboards
- School administration systems
- Marketplace
- Social feed
- Public leaderboards
- Full AI tutor
- Advanced AI chatbot
- Automatic essay grading
- Full distraction blocking
- Built-in video calls
- Messaging system
- IGCSE functionality
- Every Cambridge subject
- Payments
- Premium subscription system
- Complex recommendation engine

These are intentionally outside the first prototype.

34. IMPORTANT UX REQUIREMENT

The app must provide obvious value within the student's first few minutes.

A new user should be able to:

1. Sign up.
2. Select subjects.
3. Immediately see their subjects.
4. Open a syllabus.
5. Create a revision task.
6. Log a past-paper result.
7. See their progress.

Avoid unnecessary onboarding screens.

35. CORE USER FLOW

Build the prototype around this primary flow:

\$\$ \text{Landing Page} \rightarrow \text{Sign Up} \rightarrow \text{Select Subjects} \rightarrow \text{Dashboard} \$\$

Then:

\$\$ \text{Dashboard} \rightarrow \text{Subject} \rightarrow \text{Syllabus Topic} \rightarrow \text{Create Revision Task} \$\$

And:

\$\$ \text{Dashboard} \rightarrow \text{Past Papers} \rightarrow \text{Log Result} \rightarrow \text{Performance Insight} \$\$

These workflows should feel extremely smooth.

36. PROTOTYPE SUCCESS CRITERIA

The generated result should make it possible for our team to evaluate:

Product clarity

Can someone immediately understand what the application does?

A-Level specialisation

Does it clearly feel designed around Cambridge A-Level revision?

Ease of use

Can important actions be completed without explanation?

Visual quality

Does it look modern and credible?

Information hierarchy

Does the student know what requires attention?

Low friction

Can users interact without constantly entering unnecessary data?

Scalability of design

Could additional subjects and features later be added without redesigning the whole product?

37. FINAL INSTRUCTION

Do not simply generate a collection of attractive dashboard cards.

Think through the **entire student journey**.

Prioritize:

1. Product usefulness
2. User experience
3. Clarity
4. A-Level specialization
5. Functional interactions
6. Responsive design
7. Visual polish

in that order.

The final result should feel like the foundation of a credible EdTech startup product — not a generic AI-generated dashboard template.

Where there is tension between making the interface more impressive and making it easier to use:

Choose easier to use.

Where there is tension between adding another feature and keeping the MVP focused:

Keep the MVP focused.

Build a coherent, interactive base prototype that our team can test, compare and refine.
